

Final Reflection

Outcome1: **Define an argumentative purpose that addresses an academic debate or issue.**

Outcome2: **Adopt an open stance toward competing perspectives when addressing an academic debate or issue.**

In Project 1, I focused on introducing my topic and developing a theme about the role of machine learning in the data science discourse community. I created a research question “what role do machine learning algorithms play in the data science discourse community?”. Additionally, I also identified competing perspectives by explaining different aspects of the discourse community, such as its goals, communication methods, and use of specialized language while keeping an open stance. For example, I discussed how members communicate through platforms like GitHub, Discord, and online forums, which shows how different perspectives shape tones of speech that members of this community use according to platforms that they utilize. Additionally, in chapter two and three, I displayed different views that exist in the discourse community by providing data from both primary and secondary research data. The primary data is the data that I collected myself, whereas the secondary data is the outcome of synthesizing information from outside sources. During revision, I improved my explanations by adding clearer definitions and more detailed examples so that readers could better understand the concepts that I integrated in my paper. This project helped me grow as a writer by teaching me how to clearly introduce topics and support it with explanations, which will help me in future classes and in my career.

This assignment made me feel challenged at first because I was not used to analyzing a discourse community in depth. What motivated me was learning more about data science and its implementations. I struggled with explaining concepts to general viewers, but I improved through revisions given by my instructor and peers. My prior writing experience was more directed to people

that had had some experience with topics or discussions that I demonstrated, so this project pushed me to think more critically and link it to broader individuals. Overall, it helped me become more confident in my ability to write, especially in the academic setting.

Outcome1: Evaluate, incorporate, and document primary and secondary sources according to discipline-specific academic conventions.

Outcome2: Implement the fundamental components of embodied writing practices such as invention, drafting, collaboration, revision, and reflection.

In major project two, I focused on explaining basic concepts of machine learning and synthesizing secondary data research, which involves supervised, unsupervised, and reinforcement learning algorithms. I incorporated sources to support my explanations and included real world applications, such as finance and urban planning to strengthen my arguments. This shows how I met the outcome of evaluating and incorporating sources effectively. During revision, I improved how I connected sources to the main research question of my paper. The peer review sessions that were held in class were also valuable, as I managed to collaborate with classmates that were in the same team as me and to revise my paper using inputs from them. In addition, I also incorporated some diagrams to support explaining complex concepts. This project helped me grow by improving my research skills and ability to use evidence in my writing. These skills will be important in future classes and my career, especially when I need to support arguments with reliable information.

This project made me feel both interested and overwhelmed because there was a lot of technical information to explain, especially considering that some of the people that would read my paper might not be familiar with my topic. What challenged me the most was learning how to explain complex ideas in a simple way that various readers could comprehend. However, I was

motivated by seeing how lucrative and widely used machine learning is in real life. My prior experience with research was limited, for example the themes were chosen by my teachers instead of me, so this assignment helped me become more comfortable working with various topics. It also helped me build confidence in my ability to understand and explain technical terms.

Option1: **Learn discipline-specific methods of academic research and argumentation.**

Option2: **Contribute to an academic debate or issue using culturally-specific discourses, argumentative tactics, and languages (including one's first language and any additional languages).**

In Project 3, I conducted primary research using data from Stack Exchange, which helped me apply research methods and analyze data. I collected, cleaned, and interpreted data to identify patterns, such as how machine learning was the most frequently discussed topic in the community. I also analyzed questions to show that many discussions focus on understanding concepts rather than just definitions. Additionally, I sorted variables such as tag and year computationally to examine specific topics that were popular in the community. During revision, I improved my organization by clearly separating sections like methodology and findings, and I made my explanations easier to understand. This project helped me grow by teaching me how to use data as evidence, which is an important skill for both academic work and my future career in data-related fields.

This assignment was the most challenging for me because it required both technical and writing skills. At first, I felt overwhelmed by the deadline that I had to catch up on finishing my primary data report and mining. However, I became more motivated as I started to understand the trends in the data. My prior experience with data was pretty different, so this project pushed me to go out of my comfort zone. Even though it was not simple and quick, it was also rewarding because

I learned new skills that I can use in my future projects. It made me feel more confident in working with data and solving complex problems.

Outcome1: **Exhibit flexibility when addressing academic audiences and rhetorical situations.**

Outcome2: **Demonstrate resilience when drafting and revising academic arguments.**

In Project 4, I created a poster and video to present my research, which required me to adapt my communication for a different audience. Instead of writing a full essay, I summarized key ideas like machine learning types and research findings in a visual format. This demonstrates flexibility in addressing different audiences and using multiple forms of communication. During revision, I focused on simplifying my content, making it more applicable to the general audience, and adding visuals to improve clarity. The revision part in this project is pretty different from earlier projects because it involves video and poster adjustments for changes. This project helped me grow by improving my ability to present information, which will be useful in future classes and professional settings where clear communication is important.

This project pushed me to be more creative compared to the other assignments because I had to present my work visually. However, it was also challenging to decide what information to include and how to simplify complex ideas. I was motivated by the opportunity to present my work through a video and make it more engaging. My prior experience with presentations helped me to feel more confident, but this project still pushed me to improve my communication skills. Overall, it guides me to compose my work using different formats.
